

A greener future needs smarter skills.

How sustainable thinking and responsible AI can shape the next generation of innovators.

Lakhara Krish Vinodkumar

Enrollment No. 240840131056 • B.Tech Computer Science

PERSONAL FOCUS

Learning to build technology that respects the planet.

**B.Tech Computer Science
student**

AI for impact

I am interested in Artificial Intelligence and sustainable technologies that solve practical environmental problems.

Green computing

I want to understand how energy-aware software, data centres and hardware can reduce digital footprints.

Shared innovation

My goal is to support sustainable innovation through collaboration, responsible design and learning.

COURSE TAKEAWAYS

Five ideas now guide how I think about green innovation.

01

SDGs

A shared framework for progress

02

Renewables

Solar and wind power at scale

03

Green data centres

Efficiency as a design choice

04

AI for climate

Monitoring, modelling and insight

05

Public initiatives

Policy turning intent into action

Partnerships turn separate climate efforts into shared progress.

GREEN INFRASTRUCTURE

Smarter data centres can reduce cost and carbon at the same time.

Energy-efficient servers

AI-based cooling

Renewable electricity

Lower emissions + operating cost

**DESIGN
FOR
LESS**

GOVERNMENT INITIATIVES

Policy creates the conditions for sustainability to become everyday practice.

Digital India

Digital services and access

Smart Cities Mission

Data-enabled urban systems

National Solar Mission

Renewable-energy adoption

Swachh Bharat Mission

Cleanliness and waste awareness

Nature programmes

Afforestation and biodiversity

GREEN SKILLING

The green transition is also a talent transition.

Renewable energy

Solar, wind and grid systems

Electric vehicles

Mobility, batteries and charging

Sustainable agriculture

Precision farming and water use

Circular economy

Waste, repair and recovery

Environmental AI

Sensors, vision and prediction

Skills connect climate ambition to real careers and everyday problem-solving.

A BALANCED DEFINITION

Sustainability works only when environment, people and prosperity move together.

Daily actions: recycle • save water • conserve energy

RESPONSIBLE AI

AI can accelerate climate action—but only if we manage its footprint and ethics.

OPPORTUNITIES

- Smart farming
- Climate prediction
- Waste sorting
- Efficient energy systems

RESPONSIBILITIES

- Reduce high energy use
- Plan for e-waste
- Design ethical systems
- Keep humans accountable

CAPSTONE PROJECT

EcoVision AI makes environmental data visible—and actionable.

CONCLUSION

Green skilling + responsible AI can build a cleaner, smarter future.

The next step is to learn, collaborate and turn sustainable ideas into real-world solutions.

Thank you
